

Database Description

Taking some inspiration from IMDb, this database stores information about Korean dramas, or K-Dramas for short. While scrolling through Netflix looking for K-Dramas to watch, I noticed a relatively small collection within its database. This motivated me to build a web application so that avid K-Drama watchers can find more shows to enjoy. Users are able to find relevant K-Dramas by inputting keywords of titles into a search bar. Furthermore, the database also stores information about actors who played in K-Dramas. Sometimes when we watch a movie and become interested in a particular actor, we tend to find other movies played by that actor. Similarly, in this database, users can search for K-Dramas played by a particular actor. Users can also find out which actors are in a particular K-Drama. In terms of numbers, the database contains information for over 100 K-Dramas and over 150 actors. Additionally, users are able to search for K-Dramas using genres. There are over 25 different genres to choose from such as Crime, Thriller, Comedy, Action, to name a few. All data for the database was taken from MyDramaList, an online database for Asian TV shows.
